‘Clean, green and sustainable’ kangaroo meat? Examining the myth

“Australia is presently slaughtering kangaroos at the same time the Minister of the Environment, Peter Garret, is condemning Japan for killing whales. Despite the fact that kangaroos are a protected species under the 1975 Wildlife Act, the Minister is supporting the slaughter saying that the kill is ‘humane’ and ‘properly administered’...The Japanese say the exact same thing about their whale slaughter-that it is humane and properly managed.”

Captain Paul Watson, Sea Shepherd Conservation Society²

Introduction

An entrenched view amongst environmentalists is that the kangaroo meat industry provides those amongst us not yet willing to replace meat in our diets, with a ‘green’ and ethically acceptable protein alternative. This article examines the ‘clean, green and sustainable’ claim for kangaroo meat, arguing that it is merely a comforting myth as severe in its implications as the ones about ‘clean coal’ and ‘scientific whaling’.

A sustainable source of protein?

Kangaroo meat is considered preferable to beef, and other intensively farmed products, on the basis that kangaroo populations do not compact the soil to the degree that cows and sheep do, move in numbers through established corridors across a wide range, thus avoiding over-browsing on indigenous flora, and have digestive systems that do not release high levels of methane into the atmosphere.

However, let's embed the biological and evolutionary characteristics of kangaroos within the current environmental landscape, taking into account incremental loss of habitat such that kangaroo mobs are frequently fenced in by farms and urban fringe developments which significantly decrease their range and block their movement corridors. This can create implosive population growth, overgrazing and ultimately death by starvation or gunfire from irate farmers bent on damage mitigation. Drought and disease also take their toll, resulting in dramatic population crashes. As a recent report by wildlife ecologist Dr. Dror Ben-Ami makes clear to introduce a commercial kill into this formula is to threaten the viability of the species altogether:

“In Queensland, the commercial kangaroo industry has access to 94% of the state, leaving only six percent of the state as protected habitat for kangaroos. Red Kangaroos are quasi-extinct across 70% of Queensland, and at densities of less than 1.6 kangaroos per km² across 40% of the state. Despite these critically low levels the Queensland Government has set a harvesting quota of 15% to 20% of the remaining Red Kangaroos in 2008.”³

Similar trends are evident in other States where commercial kangaroo killing takes place. Driven by market pressures “the current situation will ultimately reduce the mature weights and sizes of future generations and could lead to a decrease in the ability of the population to survive”⁴.

A Queensland Department of Primary Industries study⁵ “puts the maximum potential supply of kangaroo meat at just 57,000 tonnes per year... In comparison cattle supply over 1,700,000 tonnes of beef each year (ABS 1999). To get 1,700,000 tonnes of kangaroo meat for human consumption, we would need ... to be killing the entire kangaroo population hundreds of times over each year.”⁶

Thus kangaroo harvesting, far from alleviating environmental degradation while producing a sustainable meat source, employs commercially-expedient methods that undermine fundamental ecological principles:

“Harvesting removes the largest and therefore fittest kangaroos (whether male or female) from the population – the ones most likely to survive extreme climatic conditions and other detrimental unpredictable events.”⁷

Nor is building up kangaroo populations through farming a viable option; not only were sheep and cows once wild and the environmental degradation we now attribute to them the result of our farming practices, kangaroos suffer capture myopathy:

“Kangaroos can't be farmed (They get severely stressed, which causes toxins to be released into their meat, so they are not good for eating).”⁸

Greens have traditionally condemned the domestication, commercialization and killing of wild species yet many of us remain blinkered with regard to our most iconic native animal. A useful

reminder is the fate of the Brushtail Rock Wallaby, hunted for fur in the 1900's, now extinct in the wild and found only in captive breeding programs⁹. With over 30% of our native mammals gone and many more on the precipice, it is foolish to think that the Kangaroo can somehow survive the combined factors inexorably leading to its destruction.

Clearly the realities of kangaroo meat do not reflect the folksy “bush food” branding; we are looking at a commercial industry annually worth \$400 million, \$270 million from export income alone:

“With more than 3 million kangaroos killed every year Australia is home to the largest annual terrestrial cull on earth.”¹⁰

Respect for life?

The commercial kangaroo industry disregards the nature of the animal it kills. Its “take” of individuals fulfils allowable quotas but ignores the complex social and family relationships of the kangaroo mob upon which the group’s survival depends.¹¹

The animal welfare issues are considerable and cannot be monitored due to the remoteness of outback locations. Dr. Ben-Ami states “that by conservative estimates 440,000 joeys die every year. There is also evidence, he says, that 40 per cent of the adults are not killed by a clean shot to the head, but by a more painful and illegal shot to the jaw or neck”¹² and consequently take off with their injuries or “are left in the field because their carcasses will not be accepted by the meat processors.”¹³ The levels of suffering escalate when we consider the fate of joeys...

“Every year some 440,000 dependent young kangaroos are either clubbed to death or left to starve after their mothers have been killed”¹⁴

Kangaroo “joeys”, up to three perishing for every harvested female kangaroo, are the industry’s “by-products” whose numbers are not even counted in the kill quotas; their treatment, enshrined in the industry’s voluntary Code of Practice¹⁵, has earned us an international reputation for brutality.

A YouTube clip (www.youtube.com/watch?v=zcMkNYOBvW8) documenting a night of outback kangaroo shooting provides a graphic challenge to Minister Garrett’s claims about a “humane” and “well-administered” kangaroo harvesting industry. Nor does a recent article the UK’s *The Daily Mail* hold back on telling it like it is:

“These little victims are bludgeoned to death and left for trash when their mothers are shot in the outback”¹⁶

Low in fat but is it healthy?

“They are killed in the dirt in summer in high temperatures.
How can you produce a clean meat under those conditions?”¹⁷

Russia is our biggest export market for kangaroo products but in 2009 banned the import of kangaroo meat following recurring instances of bacterial contamination. One has to ask, if kangaroo meat is deemed a health risk for Russian citizens, why our government is hell-bent on marketing it to us.

“Toxoplasmosis and salmonellosis are two bacterial infections that affect kangaroos and which also have significant public health implications. The infections can spread to humans through the handling, processing or consumption of infected kangaroo meat – and as many as one in two kangaroo carcasses may harbour the salmonella bacterium”¹⁸

The industry is not shy in coming forth with an answer:

“Australians could soon find themselves eating our national emblem, the kangaroo, as meat businesses look for assistance to stay afloat after their main export market in Russia collapsed...Increasing domestic consumption of kangaroo meat is considered the industry's best short-term measure”¹⁹

Conclusion

The former leader of the Australian Greens, Bob Brown, recently explained a voter shift to the Greens by saying that it is the thinking-person's party. Indeed what makes the environmentalist perspective unique is the ability to think with the heart as well as the head and place a non-negotiable value on wilderness for its ability to nourish the human spirit as well as provide the ecological basis for a rich diversity of life on our planet. In the face of such political positioning what future is envisaged for our kangaroos?

Disappearing into plastic-encased cuts of meat on the supermarket shelf as we continue to swallow the greenwashing²⁰ of the “clean&green” myth? Surely the only sustainable commercial use of kangaroos worthy of support is the development of environmentally-sensitive tourism coupled with restoration of wildlife habitat and movement corridors. Only thus can we preserve the Kangaroo's rightful place in this wild and challenging continent it has inhabited sustainably for thousands of years.
